

AeroGuard

Complete 90-Second Video Demo Script · Plain English Presentation Guide

30-Second Setup Checklist (Before you hit record):

1. Open <https://psraghothamrao8.github.io/aeroguard/> in Chrome and press **F11** for full-screen.
2. Turn your computer speaker volume to **70%** so the video recording clearly catches the sirens.
3. Press **Windows Key + Shift + R** (or open Loom/OBS) to start recording. Read naturally at your own pace!

PART 1: The Life-or-Death Problem

0:00 – 0:25 (25 Seconds)

ON-SCREEN ACTION

Move your mouse slowly across the radar map showing the runway and airplanes.

WHAT TO SAY OUT LOUD

"Hi everyone! This is

AEROGUARD

At busy airports, truck drivers tow massive 300-ton passenger airplanes across the airfield. The jet engines are deafening loud, and drivers cannot look down at phone or tablet screens while steering a giant plane. They only have a walkie-talkie radio.

If a driver mishears an instruction and accidentally drives onto the runway, a landing airplane will crash right into them. That exact tragedy happened in Tokyo earlier this year, killing five people.

That's why we built AeroGuard."

PART 2: Live Voice Recognition

0:25 – 0:45 (20 Seconds)

ON-SCREEN ACTION

Click the green button below the radar:

Start Headset

Speak into your microphone:

"Hold short of Runway 09"

(Wait 2 seconds as your words appear in the radio box).

WHAT TO SAY OUT LOUD

"AeroGuard listens to the radio in real time using AssemblyAI's voice technology."

Even over loud jet engine noise, AssemblyAI hears the voice clearly, transcribes it instantly, and locks the red stop line on our map so the driver knows not to cross."

PART 3: The Tokyo Crash Replay & Emergency Siren

0:45 – 1:15 (30 Seconds)

ON-SCREEN ACTION

Click the button above the radar:

1. Haneda Incident Replay

(Map switches to Tokyo, plane rolls forward, screen flashes red, and siren shouts: 'PULL UP! HOLD POSITION!').

WHAT TO SAY OUT LOUD

"Now watch our Tokyo Haneda crash replay."

In real life, the small plane drove past the yellow stop line in the dark, and a landing passenger plane crashed into it.

With AeroGuard, the moment the plane crosses the stop line without permission, AeroGuard detects the landing traffic and screams an emergency alarm into the pilot's headset: 'STOP! RUNWAY DANGER!'

The pilot hits the brakes, stopping the plane

14 SECONDS BEFORE THE CRASH

— saving everyone onboard."

PART 4: Catching Spoken Mistakes

1:15 – 1:30 (15 Seconds)

ON-SCREEN ACTION

Click the button above the radar:

3. Spoken Deviation Test

(Yellow warning alert appears on screen).

WHAT TO SAY OUT LOUD

"AeroGuard even catches spoken mistakes before the vehicle even moves."

If the control tower says 'Wait before the runway', but the driver mistakenly replies 'Okay, crossing the runway', AeroGuard immediately catches that misunderstanding and warns them in less than a second."

PART 5: Automatic Safety Report & Wrap-Up

1:30 – 1:45 (15 Seconds)

ON-SCREEN ACTION

In the top bar, click:

Part 139 Audit

Then click:

Download JSON

WHAT TO SAY OUT LOUD

"Finally, AeroGuard uses AssemblyAI to write the official safety incident report automatically, saving hours of paperwork for investigators."

AeroGuard turns AssemblyAI into a life-saving AI co-pilot for airports. You can test our live interactive demo on GitHub Pages. Thank you!"

Quick Concept Cheat Sheet (For Your Reference):

Runway vs Taxiway

Taxiways are the slow side roads. Runways are the high-speed tracks where giant jets land at 150 mph.

Tug (Truck #42)

The small, heavy tractor that pushes and tows big airplanes around the airport.

ATC (Air Traffic Control)

The airport traffic police sitting up in the tall control tower.

"Hold Short"

Airport slang for: "STOP BEFORE THE LINE! DO NOT CROSS THE RUNWAY!"
